

LONG HOMEWORK 4 : MATH 110 . SUMMER 2012
 (SOME TIPS)

b) TO DETERMINE $C(N_{\pi})$, π PARTITION OF 3, LET

$$A = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix} \quad \text{& CONSIDER } AN_{\pi} = N_{\pi} A.$$

c) THE RESULT

$$\text{ad}(N_n)(e_{k,l}) = \begin{cases} -e_{k,l+1}, & k=1, 1 \leq l < n \\ e_{k-1,l}, & 2 \leq k \leq n, l=n \\ e_{k-1,l} - e_{k,l+1}, & 2 \leq k \leq n, 1 \leq l < n \\ 0 & k=1, l=n \end{cases}$$

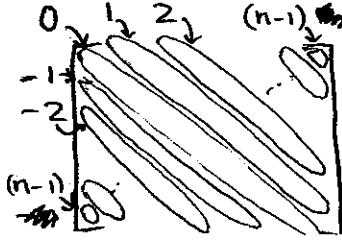

CAN BE REPRESENTED PICTORIALLY:

$$\begin{array}{c} \text{ad}(N_n) \\ k \rightarrow \end{array} \begin{bmatrix} 0 & & 0 \\ | & & | \\ 0 & \bullet & 0 \\ | & & | \\ 0 & & 0 \end{bmatrix} \xrightarrow{k=1} \begin{bmatrix} 0 & & 0 \\ | & & | \\ 0 & 1 & -1 \\ | & & | \\ 0 & & 0 \end{bmatrix}$$

SO $\text{ad}(N_n)(e_{k,l})$ IS MATRIX WITH 1 ABOVE kl -ENTRY,
 & -1 TO THE RIGHT OF kl -ENTRY.

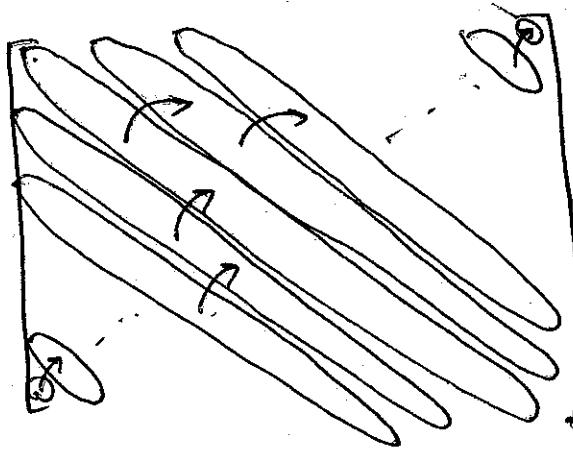

IN PARTICULAR, ON TOP ROW (ie $k=1$) WE JUST GET A
 -1 TO THE RIGHT OF kl -ENTRY; ON RIGHTMOST COLUMN,
 JUST GET A 1 ABOVE kl -ENTRY.

THINKING IN THIS MANNER YOU CAN CONVINCE YOURSELF
 THAT, IF WE LABEL THE DIAGONALS OF AN ARBITRARY $n \times n$
 MATRIX AS

so, e.g. DIAGONAL
 0 IS MAIN DIAGONAL

THEN, $\text{ad}(N_n)$ MOVES ENTRIES IN DIAGONAL i TO
ENTRIES IN DIAGONAL $i+1$

→ = ACTION
OF $\text{ad}(N_n)$
ON MATRIX
WITH ONLY
NONZERO ENTRIES
IN DIAGONAL
 i .

- c) ii) IS ASKING YOU TO SHOW THAT
DIAGONAL i IS MAPPED ONTO DIAGONAL $(i+1)$
(for $i=0, \dots, n-2$) BY $\text{ad}(N_n)$
- c) iii) IS ASKING YOU TO SHOW THAT THE RESTRICTION
OF $\text{ad}(N_n)$ TO DIAGONAL i ($i=-1, \dots, -(n-1)$)
IS INJECTIVE (RECALL, IF f INJECTIVE THEN
 f TAKES L.I. SETS TO L.I. SETS.)
